## SUMMARY

I want to improve (and redefine) how research is done.

On the tooling side, AI is only a research instrument if it generalizes reliably. My doctoral work builds identifiability theory for *when and why neural networks generalize*; my position papers argue that understanding LLMs requires more than statistical generalization, that self-supervised learning needs an empirically grounded identifiability theory, and that interpretability claims generalize only when causally grounded. I build the instruments too, from benchmarks and open tooling for AI-assisted research to a public Challenge program for verifying AI-assisted science.

On the human side, I work on how we train exceptional researchers: I write the *Path to PhD* newsletter, mentor students from their first paper to the Ph.D., and train in leadership, exercise physiology, and the psychology of high performance.

From September 2026 I join Mila and the Université de Montréal as a postdoctoral fellow with Simon Lacoste-Julien and Dhanya Sridhar, working on robust language models via identifiable causal mechanisms.
